MB Crushers

For 15 years, MB has been the leader in the fields of crushing, demolition, and recycling, by designing, producing, and selling the very first jaw bucket crusher. MB offers the largest line of patented crusher buckets all over the world. With extensive innovation and development, MB produces a complete range of crusher and screening buckets, drum-cutters and grapples for excavators, skid loaders, and backhoes of all sizes. Founded and headquartered in Italy, the family-owned company controls seven international subsidiaries with logistic centres located on different continents, as well as an extensive

network of authorised dealers and service support throughout the world.

MB crusher buckets' versatility of use and advantages have enabled companies to significantly boost their production levels. The crusher buckets tackle the material directly on site and allows the product that require crushing to be collected by placing it in a mound on the truck or directly on the site to be filled in, thus speeding up operations.

MB Crusher's products are being used by operators across the region, helping them save time and costs in their road-construction, mining and demolition operations. In its quest to find new solutions to recycle inert

waste at low cost, MB Crusher has created a product range that allows companies to manage the full cycle of crushing and recycling at the site, thus simplifying crushing, screening, and handling of aggregates while saving time and money.

"Crushing and recycling has become a key aspect of mining and crushing operations and the need to make the most of all available material has prompted astute operators to use the waste material which once was simply piled up, thrown away or brought to a disposal site," says Najmeddine Sahraoui, deputy general manager of Middle East and Africa.
