

BOSS ATTACHMENTS & MB ITALY, TAKING SCREENING APPLICATIONS TO A WHOLE NEW DIMENSION.

The days of the standard sieve bucket or shaker bucket as we like to call them, are nearing its expiry period with this great new product from MB. The MB-S Series of rotary screening buckets for excavators was first developed by MB with Patented technology in 2010. These rotary screening buckets are truly the envy of all others. Whether you have a mini excavator or big puppy like a 40 or 50 tonner, MB have you covered.

The shear fact that contractors may easily change the output size of the material being screened in minutes is a remarkable achievement by MB, and If you think screening wet material may pose a problem, then think again, the MB-S series is the only screening bucket on the market with the a patented intermittent hydraulic system therefore making it possible to efficiently screen wet materials with ease.

The possibility to directly reuse recovered materials, is particularly useful in road building, and construction and maintenance of sewers, and pipelines. MB in fact allows to complete the entire process without transporting excavated materials, with the highest respect to the environment.

We caught up with Livio from Boss Attachments to hear what he had to say about this product. We have been totally overwhelmed with the client feedback and the performances of the MB-S Series, we have placed these units in applications that others would run away from. Currently we have two units running in a quarry screening 150mm minus blue metal on a ZX450. The customer is absolutely

amazed by the performance of this bucket as it has increased productivity in the crushing plant by 60% with only one operator and one machine.

Words alone cannot explain the performances of these screeners, we have these screeners working in just about every kind of environment and application. We have these working in recycling yards, pipe lines, quarries, river applications and even a gold mine.

MB-S Rotary Screening bucket is constructed entirely from certified HARDOX, allowing these buckets to withstand extremely abrasive applications with absolutely minimal maintenance.

Advantages:

- Patented intermittent system allows you to sift through wet material, increasing production up to 60% compared to the traditional system.
- Equipped with interchangeable panels, available in different sieve sizes depending on the needs of the job. The simple assembly and dis-assembly of the screen panels makes for an easy change for different material output sizes.
- The unique and innovative conical shape of the basket was specially designed to significantly increase the hourly production and to sift through all the material collected without residue.

The MB-S Series is a must have for any serious contractor who wants turn contaminated excavated materials into a sellable product.
