THE CRUSHING EVOLUTION

MB, THE CUTTING-EDGE SOLUTION FOR QUARRIES AND CONSTRUCTION SITES

There are no longer just the buckets of yesterday. Today the market has been revolutionized by even more advanced equipment, real machinery that works in tandem with the excavator, enabling businesses to optimize their costs and increase their earnings. The MB crusher bucket is the first of its kind to appear on the market, and is one of these revolutionary pieces of equipment: patented throughout the world, flexible and agile, yet also objectively capable of cutting costs and contributing to the health of the environment. The MB crusher bucket, which is available in 12 models and entirely designed and manufactured in Italy, is exported to more than 150 countries throughout the world. There are now many testimonials from business owners who have realised the profitability of the MB crusher bucket, which is comparable, if not greater, than that of a normal mobile crusher. It has the added value of fast installation and unsurpassed use in any place, including citizens' construction sites, quarries, narrow areas or mountainous and hilly areas.

Allowing the material obtained from excavations or demolition to be reused, the MB crusher bucket enables the nature of the place to remain formed by the same elements and removes the expensive and polluting trips to landfills as well as the road wear. The latter is a very important thing, as this period in time is hardly one where waste is appropriate. It is precisely at moments like these that the market automatically selects its companies, only allowing those to move forward in which innovation, development and respect for the environment are their bread and butter. Of course, there is another fundamental aspect, namely that of money and energy-saving. And, with the MB crusher bucket, all of this is possible in that it allows to make savings on resources, personnel and transportation when used on a construction site or in a quarry. The MB buckets have many features that are immediately appreciated, such as their versatility of use, the possibility of crushing on site in any situation and the ability to reduce costs that they offer. The crusher bucket actually works in tandem with an excavator, which is normally already available on

any site. Even large companies, that already have big crushing plants within their quarries, are deciding more and more often to also adopt the MB crusher buckets, which allow them to cover many situations and special processes, such as confined areas and spaces that are difficult to access. Today the MB crusher bucket is no longer considered a niche or specialist piece of machinery, it is becoming part of the standard equipment for every construction company. In fact, the extensive know-how in the engineering sector and investment in

technology and innovation have allowed MB Crusher to offer its customers major advantages: the choices made by MB, in fact, are precise choices that, along with their activity performed with passion and desire for improvement, create the best guarantee for all those who rely on MB products because they know they can always find solutions to meet their expectations.

The testimonials collected from MB Crusher customers show that all the companies using the bucket crusher see it as being convenient both for large construction projects and for smaller jobs (the ease of transport and low production costs also make it advantageous for crushing small quantities). The maximum product specialization, production performed only in their

establishments in Fara Vicentino (Italy), major investments in research and development, and the focus on customer needs have proven to be winning strategies. These have been developed through several area managers who coordinate with the sales activity in the territory, supporting the work of dealerships in contact with the customer all over the world. It is a very vibrant international market that sees the MB bucket crushers present in many construction sites throughout the world, from Europe to the Middle and Far East, and from the Americas and to Africa.
